

Problema512: Hallar el valor de ΔG° y de la constante de equilibrio K_p a 298 K usando los datos termodinámicos de las tablas para la reacción: $\text{CaCO}_3 (s) \rightleftharpoons \text{CaO} (s) + \text{CO}_2 (g)$

$$\begin{aligned} \Delta G^\circ &= \sum n_p \cdot \Delta G^\circ_{\text{productos}} - \sum n_r \cdot \Delta G^\circ_{\text{reactivos}} = \Delta G^\circ(\text{CaO} (s)) + \Delta G^\circ(\text{CO}_2 (g)) - \Delta G^\circ(\text{CaCO}_3 (s)) = \\ &= (-604,2\text{kJ}) + (-394,6\text{kJ}) - (-1128,8\text{kJ}) = \underline{\underline{130,0\text{kJ}}} \end{aligned}$$

$$\Delta G^\circ = -RT \ln K$$

$$K = e^{-\frac{\Delta G^\circ}{RT}} = e^{-\frac{130.000\text{J}}{8.314\text{J/molK} \cdot 298\text{K}}} = \underline{\underline{1,63 \cdot 10^{-23}}}$$
